

Suppose  $T$  is a linear operator on  $V$ , a vector space over the field  $F$ . If  $p$  is a polynomial over  $F$ , then  $p(T)$  is again a linear operator on  $V$ . If  $q$  is another polynomial over  $F$ , then

$$\begin{aligned}(p+q)(T) &= p(T) + q(T) \\ (pq)(T) &= p(T)q(T)\end{aligned}$$

Therefore, the collection of polynomials  $p$  which annihilate  $T$ , in the sense that  $p(T) = 0$ , is an ideal in the polynomial algebra  $F[x]$ . It may be the zero ideal, i.e., it may be that  $T$  is not annihilated by any non-zero polynomial. But, that cannot happen if the space  $V$  is finite-dimensional.

Suppose  $T$  is a linear operator on the  $n$ -dimensional space  $V$ . Look at the first  $(n^2 + 1)$  powers of  $T$ :

$$I, T, T^2, \dots, T^{n^2}.$$

This is a sequence of  $n^2 + 1$  operators in  $L(V, V)$ , the space of linear operators on  $V$ .

$$c_0 I + c_1 T + \dots + c_{n^2} T^{n^2} = 0$$

for some scalars  $c_i$ , not all zero. So, the ideal of polynomials which annihilate  $T$  contains a non-zero polynomial of degree  $n^2$  or less.

According to Theorem 5 of Chapter 4, every polynomial ideal consists of all multiples of some fixed monic polynomial, the generator of the ideal. Thus, there corresponds to the operator  $T$  a monic polynomial  $p$  with this property: If  $f$  is a polynomial over  $F$ , then  $f(T) = 0$  if and only if  $f = pg$ , where  $g$  is some polynomial over  $F$ .

**Definition.** Let  $T$  be a linear operator on a finite-dimensional vector space  $V$  over the field  $F$ . The **minimal polynomial** for  $T$  is the (unique) monic generator of the ideal of polynomials over  $F$  which annihilate  $T$ .

The name ‘minimal polynomial’ stems from the fact that the generator of a polynomial ideal is characterized by being the monic polynomial of minimum degree in the ideal. That means that the minimal polynomial  $p$  for the linear operator  $T$  is uniquely determined by these three properties:

- (1)  $p$  is a monic polynomial over the scalar field  $F$ .
- (2)  $p(T) = 0$ .
- (3) No polynomial over  $F$  which annihilates  $T$  has smaller degree than  $p$  has.

If  $A$  is an  $n \times n$  matrix over  $F$ , we define the **minimal polynomial** for  $A$  in an analogous way, as the unique monic generator of the ideal of all polynomials over  $F$  which annihilate  $A$ .
